Why Food Allergy Testing Matters:

A food allergy test can offer significant clinical benefits, especially when patients present with symptoms such as:

- Skin reactions (e.g., urticaria, eczema)
- Gastrointestinal issues (e.g., bloating, nausea, diarrhea)
- Respiratory symptoms (e.g., wheezing, nasal congestion)

Benefits Include:

- Identification of specific food triggers
- Reduction of unnecessary dietary restrictions
- Support for elimination diets
- Improved quality of life and symptom control

Partner with Qlabs for Reliable Allergy Diagnostics

Qlabs provides a range of robust, clinically validated allergy panels to support diagnostic accuracy and optimal patient outcomes.

LABORATORY TESTS FOR ALLERGY

Knock out medical emergencies, before it's too late

QFood44

Food Allergen Panel

Identify Immediate-Type Food Allergies with Confidence

The **QFood44 Food Allergen Test** detects Type 1 hypersensitivity reactions, which involve the production of specific **IgE antibodies** in response to food allergens. These reactions occur rapidly typically within minutes to hours after exposure and are commonly responsible for symptoms such as hives, gastrointestinal discomfort, and respiratory issues.

Contributing factors include:

- Genetic predisposition
- Allergen exposure
- Nutritional status
- Co-existing chronic or viral illnesses

This test aids in pinpointing trigger foods, supporting a more accurate diagnosis and individualized dietary management.

QResp44

Respiratory Allergen Panel

Comprehensive Screening for Inhalant Allergens

The **QResp44 Respiratory Allergen Test** identifies inhaled allergens that may provoke IgE-mediated reactions in the respiratory system.

Common symptoms include:

- Sneezing and nasal congestion
- Coughing and wheezing
- Shortness of breath
- Aggravation of asthma

This panel covers a wide range of airborne allergens such as pollen, dust mites, molds, and animal dander—essential for managing conditions like allergic rhinitis and asthma.

QAllergyPro

295 Comprehensive Allergy Panel

The Next Generation in Allergy Diagnostics

QAllergyPro is an advanced **solid-phase immunoassay** using nano-particle-coupled allergen extracts and molecular allergens arranged on a microarray.

It includes:

- **295 allergens**, including **178 molecular components**
- Broader diagnostic capability for complex or cross-reactive allergies
- Enhanced precision for **personalized treatment plans**

This state-of-the-art test allows clinicians to offer **evidence-based, targeted therapy** by identifying both primary and cross-reactive sensitizations.
